1/1 point (graded)

Bond and DePaulo reported an average lie-detection accuracy for regular people of 54%. Generally, why are people not very good at detecting if someone is lying to them?

☐ Because there's a part of our brains that develops in time that enables us to detect if others are lying. For most of us, this part of our brain just hasn't developed yet.

☐ Because it's not often that people have to detect if others are lying, so they haven't had a chance to develop the necessary skills.

☒ Because people are most influenced by the characteristics of lying that are inaccurate and they ignore the accurate characteristics. ✓

☐ Because people don't like to be confrontational when others are lying to them.
